4 DEC 1962

MEMORANDUM FOR: Chief, Development Division, OSA

SUBJECT: A-12 Fuel Gauge Accuracy

25X1

1. During [redacted] recent visit to Headquarters he reported that the presently installed fuel quantity gauges are unreadable below 10,000 pounds. The scale markings and range of the indicator are such that low fuel readings are not available to the pilot.

2. If this is in fact the case, such a situation is operationally unacceptable. The need to know fuel remaining at quantities at and below 10,000 is vitally important.

3. It is requested that this matter be researched and appropriate action be instituted to provide readable fuel gauges to include the low scale region.
